 Uche Nwafor (UNN)

ESA Living Planet Symposium, Room 1.14, Vienna. 23 June, 2025

- i. The primary goal of the project is to expand the existing meteorology-based national drought early warning system by incorporating indicators relevant to monitoring agricultural droughts, such as soil moisture and vegetation health/stress.
- ii. To enhance the resilience of rainfed rice production systems to droughts by providing accurate and timely information.
- iii. Validate the EO based methodology utilizing on-site data including farm surveys.

- i. Improved agricultural drought early warning systems.
- ii. Increased rice yields and food security.
- iii. Leveraging on the current project by future research into critical topics that affect food security.

- **SAMPLING & FIELD DATA COLLECTION**

- Multi-Stage Sampling Technique (Selection Criteria)
 - First Stage: 5 States and have visited 4 (Ebonyi, Nasarawa, Nigeria and Ogun states).
 - Second Stage: 10 Local Government Areas and 39 rice-producing communities.
 - Third Stage: 226 rainfed rice Farmers (IFAD-VCDP).
 - Sampling unit: Single rice plots.
- The design of the farm survey was based on the four Pillars of Drought Management.
- Administration of the survey and collection of historical yield data.
- GPS field-observed coordinates of the boundaries of the sample rice plots.

SURVEY ANALYSIS & DISCUSSION

DEMOGRAPHY	<ul style="list-style-type: none"> • Total Rice Farmers Surveyed:226 • Male: 199 (88.1%) • Female: 27 (11.9%) 	<ul style="list-style-type: none"> • Significant gender disparity. • Socio-economic and Cultural factors that limit women's access to land and support programs.
FARMING PRACTICES	<ul style="list-style-type: none"> • Avg. Plot Sizes: 0.25-5 Hectares • Rice Variety: FARO 44 (57.1%), OFADA (23.9%), Others(15.6%) • Ecology: Rainfed lowland & Upland • Planting & Harvest months (June:46.5% - October: 30.1%) 	<ul style="list-style-type: none"> • Smallholder Rice farmers. • Prevalence of high yield – drought-resistant variety • Dominance of rainfed lowland/shallow swamps. • Staggering in establishment months denotes heavy dependence on seasonal rains and adjustments to changing rainfall patterns.
RICE FARMERS DROUGHT PERCEPTION	<ul style="list-style-type: none"> • 2019 (4.5% of farmers reported moisture shortages) • 2020 (14%), 2021 (9.25%), 2022 (18%), 2023 (20.75%) & 2024 (34%) • Peak Months of stress: July (29.2%), August (29%) & June (15.3%) 	<ul style="list-style-type: none"> • Steady increase across the years in reports of drought-like phenomena by Rice farmers. • Changes in Climatic Conditions (hotter temperatures, shifting precipitation patterns, and longer dry spells). • Crucial window for targeted drought mitigation efforts.

SURVEY ANALYSIS & DISCUSSION

DROUGHT IMPACT

- Crop Calendar: 44.2% reported changes, while 55.8% did not change.
- Reported crop losses (Panicle Initiation: 58%, Tillering: 23.7%, Milk-Dough: 14.1% & Full maturity 4.2%).
- Yield losses: Avg. 2020-2023 (34.3%), 2024 (55%).
- Growing awareness of climate variability.
- Higher Crop losses due to moisture shortage at the critical stage of crop growth.
- Substantial loss in 2024, marking a 60.17% increase.

EARLY WARNING & INFORMATION SOURCES

- 51.8% received alerts on climatic changes (flooding, precipitation patterns).
- 48.2% had never received any alerts.
- Radio (44.6%).
- Extension Officers (26.7%).
- WhatsApp & Social Media: (6.86%).
- Other Sources (20.84%).

COLLABORATION VISIT TO UNN

NEXT STEPS...

MOFODRONI

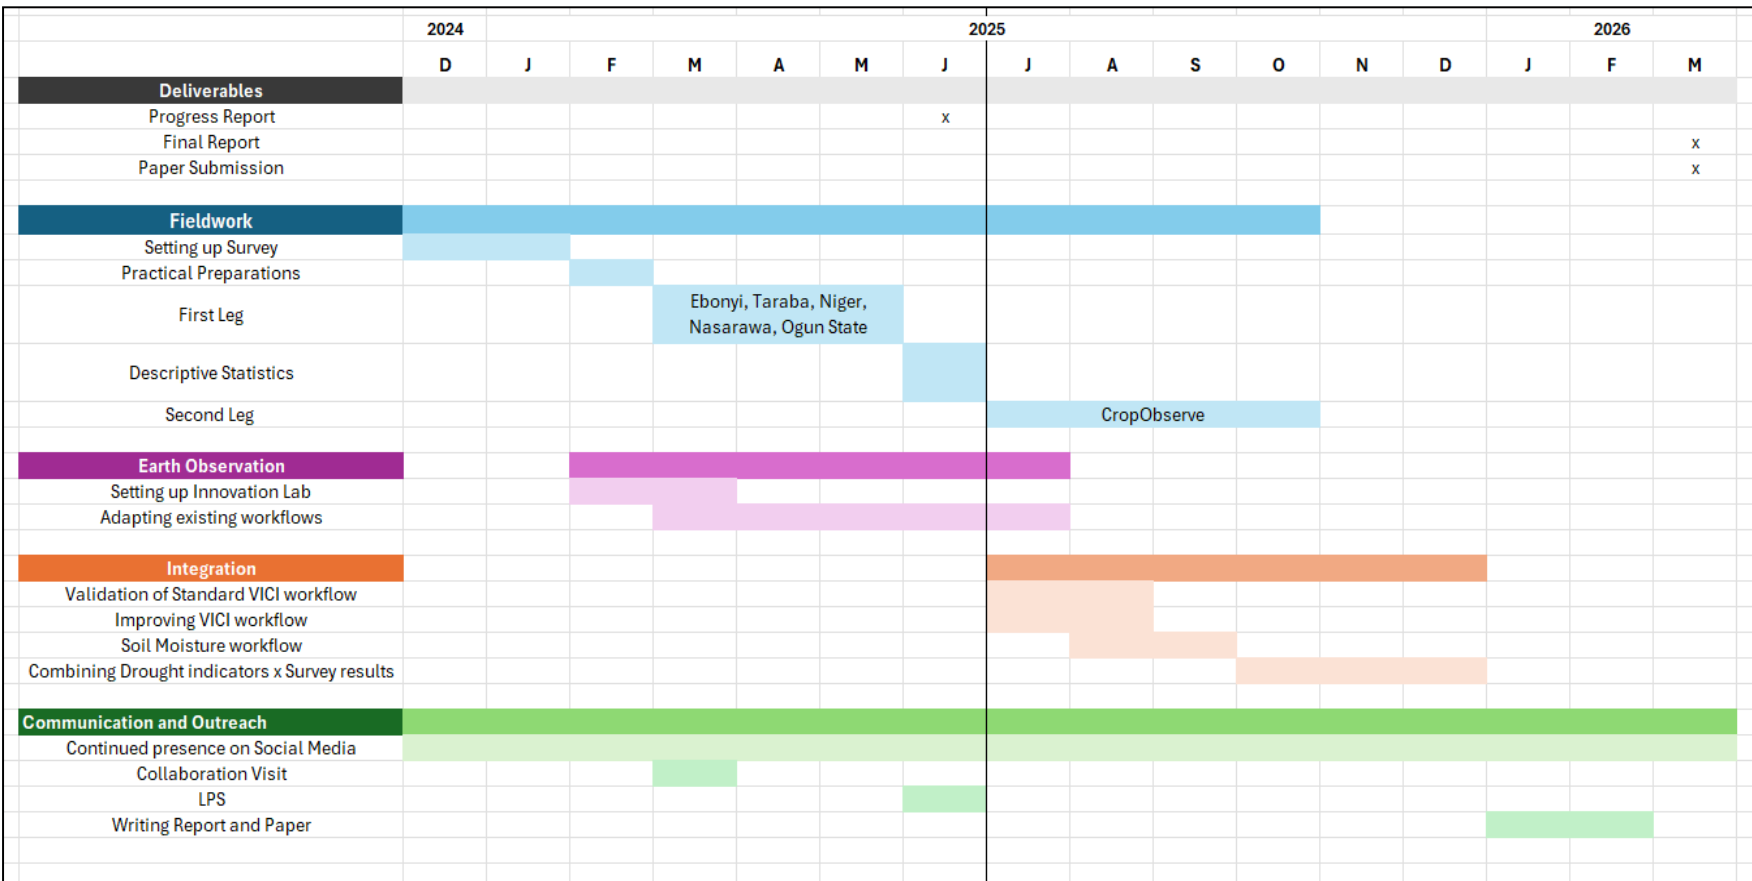

Figure 7: Project workflow

- Deep-dive into current workflows:
 - = How well do they describe the situation on the field?
 - Vegetation (NDVI/VICI)
 - Soil Moisture (SWI)
- Integrate survey results into EO workflow
 - = How can we use the survey results to improve the existing workflows? (redefine zoning, combination of indicators, validation...)

THANK YOU.
